GENERAL INFORMATIONS

IMPORTANT CONSIDERATIONS

- Most cases of acute rhinosinusitis are caused by a virus, and only a small percentage are complicated by bacterial infection.
- Most cases of acute rhinosinusitis are self-limiting and resolve spontaneously within 10 to 14 days.
- Judicious antibiotic prescription is a contentious issue because antibiotic therapy is generally not needed, even for the treatment of acute bacterial rhinosinusitis.
- The increase in antimicrobial resistance is directly linked to the prescribed amount of antibiotics.

PATHOGENS

</tr>
</tbody>
</table>

PREVENTIVE MEASURES

- Hand-washing
- Smoking cessation

DIAGNOSIS

ACUTE RHINOSINUSITIS

For a diagnosis of acute rhinosinusitis, more than one of the main symptoms must be present.

Main symptoms:
- Unilateral dental or facial pain
- Nasal obstruction or congestion
- Coloured anterior or posterior rhinorrhea

Other symptoms to consider:
- Headache
- Hyposmia/anosmia
- Cough

- The nose and the back of the throat should be examined to look for:
  - Purulent secretions between the middle turbinate and the lateral nasal wall (middle meatus) using an otoscope.
  - Secretions in the back of throat.
- Palpation or percussion of the maxillary or frontal sinuses may be helpful for the diagnosis.
- The symptoms of acute bacterial rhinosinusitis and acute viral rhinosinusitis overlap.
The diagnosis of acute bacterial rhinosinusitis will depend on one of the following two clinical situations:

- The symptoms persist (for 10 to 14 days) without improvement.
- The symptoms worsen 5 to 7 days after an initial improvement (biphasic infection).

If either of these two criteria is met, treatment will be guided by the illness's impact on the patient's functional status.

### IMPACT SIGNS AND SYMPTOMS ACTIONS

<table>
<thead>
<tr>
<th>IMPACT</th>
<th>SIGNS AND SYMPTOMS</th>
<th>ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>MILD</td>
<td>Slight discomfort with a minor impact on the patient’s functional status</td>
<td>Use adjunct therapies only</td>
</tr>
<tr>
<td>MODERATE</td>
<td>Discomfort and constant tolerable symptoms with a moderate impact on the patient’s functional status</td>
<td>Use adjunct therapies before considering antibiotics. Close observation is also an option</td>
</tr>
<tr>
<td>SEVERE</td>
<td>Major impact on the patient’s functional status and sleep</td>
<td>Consider using antibiotics</td>
</tr>
</tbody>
</table>

### DANGER SIGNS

- Significant deterioration in the patient’s overall condition
- Severe headache (risk of frontal or sphenoid rhinosinusitis or of central nervous system changes)
- Measured persistent fever (> 38 °C)
- Periorbital edema/redness

Refer immediately to hospital.

### TREATMENT PRINCIPLES

#### SUPPORTIVE TREATMENTS

**Relief of discomfort, facial pain and measured fever**

- Antipyretic and analgesic medications

**Relief of facial pain, nasal congestion and purulent rhinorrhea**

- Nasal irrigations with a saline solution at least twice a day.
  
  *There is no evidence that using a nasal spray provides any symptomatic relief, but data indicate that irrigations provide slight relief.*

- A topical decongestant at the lowest concentration when nasal congestion is most bothersome (e.g., at night)
  
  *There is no evidence that using a decongestant once a day for less than 10 days leads to rebound congestion.*

- Intranasal corticosteroids\(^1\) provide a **modest therapeutic benefit**, but their routine use is not encouraged. However, they may be useful in patients with an allergic component or with recurrent episodes.

  Of 15 patients with acute rhinosinusitis who used intranasal corticosteroids for an extended period (15 to 20 days), only one experienced global symptomatic improvement.

1. In Canada, only mometasone furoate monohydrate has a therapeutic indication for acute rhinosinusitis.
HISTORY OF ALLERGIC REACTION TO A PENICILLIN ANTIBIOTIC

- True penicillin allergy is uncommon. For 100 people with a history of penicillin allergy fewer than 10 will be CONFIRMED to have a true diagnosis of allergy.
  - It is therefore important to carefully assess the allergy status of a patient who reports a history of allergic reaction to penicillin, before considering using alternatives to beta-lactams. For help, consult the decision-making tool in case of allergy to penicillins.

ANTIBIOTIC THERAPY

- Antibiotic effectiveness is modest, and the literature reports that:
  - Of approximately 17 patients with acute bacterial rhinosinusitis treated with antibiotics, only one experienced global symptomatic improvement.
  - Of approximately 18 patients with acute bacterial rhinosinusitis treated with antibiotics for a period of 7 to 14 days, only one experienced a shortened duration of symptoms.
  - Of approximately 8 patients with acute bacterial rhinosinusitis who received an antibiotic, one experienced adverse effects.

Close observation, which consists in not immediately prescribing an antibiotic and asking the patient to see his/her doctor again if the symptoms worsen or do not improve within 48 to 72 hours, is a valid option for patients who are moderately impacted by the illness.

- If the patient has been on antibiotics for the last 3 months, prescribe a different class of antibiotics
- There is no indication for the use of azithromycin in the treatment of acute bacterial rhinosinusitis

ANTIBIOTIC THERAPY FOR ACUTE BACTERIAL RHINOSINUSITIS

1. Antibiotics are listed here alphabetically by their generic name.
2. Amoxicillin, 1000 mg PO BID: There is no scientific data to support recommending or prohibiting this dosage.
3. Risk factors for developing antibiotic resistance: Close contact with a child under the age of 2 at a day-care centre, high regional prevalence of antibiotic resistance, smoking, age > 65.
4. The 7:1 (875/125 mg) PO BID formulation of amoxicillin/clavulanate is preferred because of its better gastrointestinal tolerance.
5. Ciprofloxacin (500 mg PO BID x 7 days) may be indicated for the treatment of patients with infections caused by the following microorganism strains: *Haemophilus influenza* and *Moraxella catarrhalis*. 

ACUTE RHINOSINUSITIS IN ADULTS
Stay up to date at inesss.qc.ca
Refer the patient to a specialist if:

- Complications are suspected;
- The rhinosinusitis is recurrent (> 3 episodes per year);
- The symptoms persist for more than 8 weeks (chronic rhinosinusitis).

**MAIN REFERENCES**

Please note that other references have been consulted.
SEVERITY OF PREVIOUS ALLERGIC REACTION TO PENICILLIN ANTIBIOTICS

**Vague history**
- Immediate reaction
  - Isolated cutaneous involvement (urticaria and/or angioedema)
- Delayed reaction
  - Isolated cutaneous involvement (Rash and/or urticaria and/or angioedema)

**Non-severe reaction**
- Immediate reaction
  - Anaphylaxis
- Delayed reaction
  - Severe skin reaction (desquamation, pustules, vesicles, purpura with fever or joint pain, but no DRESS, SJS/TEN, or AGEP)
  - Serum sickness

**Severe reaction**
- Immediate reaction
  - Anaphylactic shock (with or without intubation)
- Delayed reaction
  - Hemolytic anemia
  - Renal involvement
  - Hepatic involvement
  - DRESS, SJS/TEN, AGEP

**Very severe reaction**
- Immediate reaction
  - Anaphylactic shock
- Delayed reaction
  - Severe skin reaction (desquamation, pustules, vesicles, purpura with fever or joint pain, but no DRESS, SJS/TEN, or AGEP)
  - Serum sickness

**Unconvincing history reported by patient or family**
- Immediate reaction
- Delayed reaction

**The following can be prescribed safely**
- **Dissimilar cephalosporins**
  - Cefuroxime axetil or Cefixime

**Prescribe the following with caution**
- **Penicillins**
  - Amoxicillin +/- Clavulanate
  - The 1st dose should always be administered under medical supervision.
  - If history of:
    - Immediate reactions, a drug provocation test should be performed;
    - Delayed reactions, the patient or his/her family should be informed of the possible risk of recurrence in the days following initiation of the antibiotic.

**Avoid prescribing**
- **Beta-lactams**
  - Choose another class of antibiotics.
  - If history of:
    - Immediate reactions, a drug provocation test should be performed;
    - Delayed reactions, the patient or his/her family should be informed of the possible risk of recurrence in the days following initiation of the antibiotic.

**Avoid prescribing**
- **Penicillins**
  - Amoxicillin +/- Clavulanate

**If a Beta-lactam cannot be administered, the following can be prescribed...**
- **Clarithromycin or Doxycycline or Sulfamethoxazole/Trimethoprim**

---

1. Immediate reaction (type I or IgE-mediated): usually occurs within one hour after taking the first dose of an antibiotic.
2. Delayed reaction (types II, III and IV): may occur at any time from one hour after administration of a drug.
3. Delayed skin reactions and serum sickness-like reactions that occur in children on antibiotic therapy are generally non-allergic and may be of viral origin.
4. Anaphylaxis without shock or intubation: requires an extra level of vigilance.
5. With no recommendations concerning other beta-lactams.
6. Penicillins, cephalosporins and carbapenems.

For further information, see the interactive tool and the decision-making tool.

AGEP: acute generalized exanthematous pustulosis;
DRESS: drug reaction with eosinophilia and systemic symptoms;
SJS: Stevens–Johnson syndrome;
TEN: toxic epidermal necrolysis.
# First-Line Antibiotic Therapy for Acute Bacterial Rhinosinusitis

If History of Allergic Reaction to a Penicillin Antibiotic

</tr>
</tbody>
</table>

1. Amoxicillin, 1000 mg PO BID: There is no scientific data to support recommending or prohibiting this dosage.
2. The 7:1 (875/125 mg) PO BID formulation of amoxicillin/clavulanate is preferred because of its better gastrointestinal tolerance.
3. Sulfamethoxazole/trimethoprim is no longer recommended for the empirical treatment of acute rhinosinusitis in adults due to increased resistance rates in *S. pneumoniae* and *H. influenzae*. However, it is still endorsed by Canadian guidelines as an option in beta-lactam-allergic individuals.
4. Penicillins, cephalosporins and carbapenems.

*If the cautious administration of penicillin is the option chosen, opt for amoxicillin/clavulanate instead of amoxicillin alone if any of the following applies: suspicion of high resistance, patient in an immunocompromised state or has frontal or sphenoidal sinusitis.*
